There is a variety of different similar products for this procedure beyond the ones demonstrated in this session.

Ellipsys™

Vascular Access System

New Solution for Fistula Creation

Designed for ESRD patients requiring hemodialysis, the Ellipsys™ system is a unique single-catheter, nonsurgical option for physicians to create an arteriovenous (AV) fistula, a traditionally invasive procedure that — until the advent of percutaneous AVF technology — had not changed in more than 50 years.

Indications

The Ellipsys™ system is indicated for the creation of a proximal radial artery to perforating vein anastomosis via a retrograde venous access approach in patients with a minimum vessel diameter of 2.0 mm and less than 1.5 mm of separation between the artery and vein at the fistula creation site who have chronic kidney disease requiring dialysis.

Product details

The Ellipsys System:

- Is minimally invasive
- Requires only venous access
- Is a single-catheter system
- Uses ultrasound visualization only — requires no fluoroscopy
